

Table of contents

Forword	10
Introduction	12
1. Defects and Plastic Deformation in Solids	16
1.1 Crystal defects: the zoo	17
1.1.1 Point defects	17
1.1.2 Line defects	17
1.1.3 Grain boundaries	19
1.2 Moving defects and their contribution to plastic deformation	22
1.2.1 Point defect mobility	22
1.2.2 Dislocation mobility	22
1.2.3 Grain boundary mobility	24
1.3 From crystal defects to creep	25
1.3.1 Flow resulting from mass transport	25
1.3.2 Flow resulting from the transport of shear	26
1.3.3 Flow resulting from grain boundary motion	27
1.4 Transformation plasticity	28
1.5 Plasticity of non-crystalline solids	30
2. The Earth Through Minerals	32
2.1 Structure and dynamics of the Earth	33
2.2 Some key mineral actors	38
2.2.1 Quartz and its high-pressure polymorphs	38
2.2.2 Olivine	40
2.2.3 Phyllosilicates (serpentine & talc)	41
2.2.4 Wadsleyite	42
2.2.5 Ringwoodite	43
2.2.6 Bridgmanite	44
2.2.7 Post-perovskite	45
2.2.8 Ferropericlaase	46
3. Techniques	48
3.1 Modelling defects and their mobility at the atomic scale	49
3.1.1 Generalized stacking faults	49
3.1.2 Modelling dislocations with the Peierls-Nabarro model	50
3.1.3 Modelling dislocation cores at the atomic scale	53
3.1.4 Modelling dislocation glide: lattice friction and thermal activation	57
3.1.5 Modelling transient states: the nudged elastic band method	59
3.1.6 Modelling deformation twinning	61
3.1.7 Modelling grain boundaries	63
3.2 Modeling plasticity at the mesoscale	64
3.2.1 2.5-Dimensional dislocation dynamics	64
3.2.2 Disclinations in grain boundaries: from atomistic to continuous	66
3.3 Transmission Electron Microscopy	69
3.3.1 Electron Tomography of dislocations	69
3.3.2 4D-Scanning (Precession) Electron Diffraction (4D-SPED)	73
3.3.2.1 Automated orientation mapping in the TEM (ACOM-TEM)	73
3.3.2.2 Dislocation imaging using 4D-SPED	75

3.3.3	Connecting electron microscopy observations to continuum mechanics	76
3.3.3.1	Potential plastic strain(-rate) associated with dislocation lines	76
3.3.3.2	The Nye tensor: from dislocations to continuum fields	77
3.3.3.3	Coupling transmission electron microscopy to Dislocation Dynamics (DD)	79
3.4	Nanomechanical testing	81
3.4.1	Micromechanics of polymer-supported thin films	81
3.4.2	Nanoindentation	81
3.4.3	On chip nanomechanical testing	83
3.4.4	Push-to-Pull	85
4.	Dislocation Glide in Minerals	90
4.1	Olivine	91
4.1.1	[001] dislocations in forsterite	91
4.1.2	[100] dislocations in forsterite	93
4.2	Wadsleyite and Ringwoodite	96
4.2.1	Dislocation glide in wadsleyite	96
4.2.2	Wadsleyite: from dislocation glide to the viscoplastic behavior of polycrystalline aggregates	97
4.2.3	Dislocation glide in ringwoodite	98
4.3	Bridgmanite	101
4.3.1	Dislocation cores and lattice friction	101
4.3.2	Thermally activated dislocation glide	102
4.4	Post-perovskite	104
4.4.1	Dislocation cores and lattice friction	104
4.4.2	$\langle 110 \rangle \{110\}$ deformation twinning	107
4.4.3	Thermally activated dislocation glide – kink-pair mechanisms	109
4.5	Broader Impact and Extensions	113
4.5.1	Cementite	113
4.5.2	MAX phases	116
4.5.3	Ice X	118
4.5.4	Phase A	120
5.	Modeling Creep: The Importance of Climb	122
5.1	Diffusion and creep in MgO	123
5.1.1	Diffusion mechanism of bound Schottky defect in MgO	123
5.1.2	Interaction between dislocation and vacancies in MgO	124
5.1.3	Efficiency of vacancy pipe diffusion along edge dislocations in MgO	126
5.1.4	Creep of MgO in the lower mantle	127
5.1.4.1	Diffusion coefficients at mantle pressures and temperatures	127
5.1.4.2	Modeling dislocation creep of periclase at ambient pressure	128
5.1.4.3	Modeling dislocation creep of periclase under mantle conditions	129
5.2	Observations supporting the hypothesis of mixed-climb displacement of dislocations in quartz	131
5.3	Creep in olivine	134
5.3.1	The message from microstructures: on the role of climb and recovery	134
5.3.1.1	Geometry of slip	134
5.3.1.2	Dislocation interactions	137
5.3.1.3	Recovery	137
5.3.2	Dislocation dynamics modeling of creep in olivine	138
5.3.2.1	High-temperature creep	138
5.3.2.2	Extending to low temperatures	140
5.3.2.3	On the power law breakdown	141
5.4	Pure climb (Nabarro) creep	143
5.4.1	Climb dissociation in perovskite: strontium titanate (SrTiO_3)	143
5.4.2	Climb dissociation in perovskite: bridgmanite (MgSiO_3)	144
5.4.3	Climb as a deformation mechanism	145
5.4.4	Pure climb (Nabarro) creep in bridgmanite	146

6. Grain Boundaries	150
6.1 Modeling disclinations	151
6.1.1 Disclinations as a structural component of grain boundaries	151
6.1.2 Disclination dynamics and shear-induced grain boundary migration	153
6.1.3 Disclinations, disconnections and shear-induced grain boundary migration	153
6.2 Grain boundaries and disclinations in MgO	155
6.2.1 Atomic description	155
6.2.2 Influence of atomic fraction	156
6.2.3 Effect of pressure	156
6.2.4 Continuous fields and disclinations	158
6.3 Grain boundaries and disclinations in olivine	160
6.3.1 Continuous description of a grain boundary in forsterite	160
6.3.2 Observation of disclinations in olivine by EBSD	161
6.3.3 Grain boundary complexions, stability and metastability	162
6.3.4 Twist grain boundaries in forsterite	164
6.3.5 Inclination angle and (0kl)/[100] tilt grain boundaries in forsterite	165
6.3.6 Shear behavior and disconnections	165
6.3.7 Grain boundary migration in forsterite: MD simulations	166
6.3.8 Grain boundary migration in forsterite: TEM observations	166
7. Minerals under High Stress - Amorphization	170
7.1 Ultimate properties	171
7.1.1 Orthoenstatite (OEN)	171
7.1.2 Olivine	173
7.1.2.1 Ideal tensile and shear stresses	173
7.1.2.2 Cleavage	174
7.2 Amorphization	175
7.2.1 Amorphization of olivine and grain boundary sliding	177
7.2.1.1 Discovery of the phenomenon	177
7.2.1.2 What amorphous intragranular bands reveal about the deformation mechanism	181
7.2.1.3 <i>In situ</i> TEM observation of amorphization at olivine grain boundaries	183
7.2.2 Deformation of phyllosilicates	186
7.2.2.1 Antigorite	186
7.2.2.2 Talc	188
7.2.3 Amorphization as a transformation plasticity mechanism	193
7.3 Rheology of amorphous olivine	197
7.3.1 Atomic scale modelling	197
7.3.2 Nanomechanical testing	201
7.3.2.1 Deposition of amorphous olivine by pulsed laser deposition (PLD)	201
7.3.2.2 Crystallization of amorphous olivine	201
7.3.2.3 Strength of a-olivine thin films	205
7.3.2.4 Nanoindentation	206
7.3.2.5 Tension-on-Chip (TOC) tensile testing	207
7.3.2.6 <i>In situ</i> tensile testing	209
8. Implications	214
8.1 Olivine in the lithospheric mantle: weaker than previously thought?	215
8.2 Grain-boundary amorphization as a possible origin of the Lithosphere-Asthenosphere Boundary	218
8.3 Amorphization as a deformation mechanism: rheological implications	221
8.3.1 Amorphization as transformation plasticity	221
8.3.2 Mechanistic framework of solid-state amorphization	221
8.3.3 Amorphization and grain boundary sliding	223
8.3.4 Stress-induced amorphization in nature: where is the evidence?	224

8.4 From crust to deep mantle: the role of dislocation climb	227
8.4.1 Pure climb creep in the deep mantle	227
8.4.2 Limits of grain-size-based rheological models in the mantle	232
8.4.3 Climb in the upper mantle: olivine	233
8.4.4 Mixed climb in the continental crust: quartz	234
8.5 Weak mechanical layer at the core–mantle boundary	236
8.5.1 The role of post-perovskite	236
8.5.2 Iron-rich magnesiowüstite and ULVZs	238
8.6 Bridging strain-rate scales: when mechanisms persist and when they change	242
8.6.1 Scaling laws and the assumption of mechanism invariance	242
8.6.2 Crystalline minerals: when mechanisms change with strain rate	243
8.6.3 Amorphous olivine: a rare case of strain-rate invariance	244
8.6.4 Lessons for extrapolating rheology across timescales	245
8.7 Crystallization of amorphous olivine: from nanoscale experiments to the interstellar medium	247
8.7.1 Iron-assisted crystallization pathways	247
8.7.2 From nanoscale experiments to astrophysical implications	249
Conclusion	252
